

# **CS23336-Introduction to Python Programming**

Started on Monday, 21 October 2024, 9:09 PM

State Finished

Completed on Tuesday, 22 October 2024, 6:44 PM

**Time taken** 21 hours 35 mins **Marks** 10.00/10.00

**Grade 100.00** out of 100.00

# **Question 1**

Correct Mark 1.00 out of 1.00  $\square$  Flag question

#### **Question text**

Program to print all the distinct elements in an array. Distinct elements are nothing but the unique (non-duplicate) elements present in the given array.

Input Format:

First line take an Integer input from stdin which is array length n.

Second line take n Integers which is inputs of array.

**Output Format:** 

Print the Distinct Elements in Array in single line which is space Separated

**Example Input:** 

Э

12234

Output:

1234

**Example Input:** 

112233

Output:

1 2 3

For example:

## **Input Result**

5 1 2 2 1 2 3 4 3 4

```
n=int(input())
a=[]
for _ in range(n):
    b=int(input())
    a.append(b)
a=set(a)
print(*a)
```

Input Expected Got

Passed all tests!

Correct

1 2 3

Marks for this submission: 1.00/1.00.

1 2 3 4 5 1 2 3 4 5

# **Question 2**

Correct Mark 1.00 out of 1.00  $\square^{\mathbb{P}}$  Flag question

## **Question text**

The **DNA sequence** is composed of a series of nucleotides abbreviated as 'A', 'C', 'G', and 'T'.

• For example, "ACGAATTCCG" is a **DNA sequence**.

When studying **DNA**, it is useful to identify repeated sequences within the DNA.

Given a string s that represents a **DNA sequence**, return all the **10-letter-long** sequences (substrings) that occur more than once in a DNA molecule. You may return the answer in **any order**.

#### **Example 1:**

```
Input: s = "AAAAACCCCCAAAAACCCCCCAAAAAGGGTTT"
Output: ["AAAAACCCCC","CCCCCAAAAA"]
```

#### Example 2:

Input: s = "AAAAAAAAAAA"
Output: ["AAAAAAAAA"]

For example:

Input Result

AAAAACCCCCAAAAAGGGTTT AAAAACCCCCC

Answer:(penalty regime: 0 %)

```
def dna(s):
  seq={}
  res=[]
  for i in
range(len(s)-9):
     s1=s[i:i+10]
     if s1 in seq:
        seq[s1]+=1
     else:
        seq[s1]=1
  for s1,c in
seq.items():
     if c>1:
        res.append(s1)
  return res
res1=dna(input())
for s1 in res1:
  print(s1)
```

#### **Feedback**

Input	Expected	Got

ΑΑΑΑΑΑΑΑΑ ΑΑΑΑΑΑΑΑΑ

Passed all tests!

Correct

Marks for this submission: 1.00/1.00.

# **Question 3**

Correct
Mark 1.00 out of 1.00

□ Flag question

#### **Question text**

You are given an integer tuple <code>nums</code> containing distinct numbers. Your task is to perform a sequence of operations on this tuple until it becomes empty. The operations are defined as follows:

- 1. If the first element of the tuple has the smallest value in the entire tuple, remove it.
- 2. Otherwise, move the first element to the end of the tuple.

You need to return an integer denoting the number of operations required to make the tuple empty.

## **Constraints**

Input: nums = (3, 4, -1)

- The input tuple nums contains distinct integers.
- The operations must be performed using tuples and sets to maintain immutability and efficiency.
- Your function should accept the tuple nums as input and return the total number of operations as an integer.

#### Example:

```
Output: 5

Explanation:
Operation 1: [3, 4, -1] -> First element is not the smallest, move to the end -> [4, -1, 3]
Operation 2: [4, -1, 3] -> First element is not the smallest, move to the end -> [-1, 3, 4]
Operation 3: [-1, 3, 4] -> First element is the smallest, remove it -> [3, 4]
Operation 4: [3, 4] -> First element is the smallest, remove it -> [4]
Operation 5: [4] -> First element is the smallest, remove it -> []
Total operations: 5
```

For example:

```
Test Result
print(count_operations((3, 4, -1))) 5
```

```
Answer:(penalty regime: 0 %)
```

```
def
count_operations(num
s: tuple) -> int:
    # Your
implementation here
    op=0
    nums=list(nums)
    while nums:
    if
nums[0]==min(nums)
:
        nums.pop(0)
    else:
nums.append(nums.p
op(0))
    op+=1
return op
```

# Reset answer

**Feedback** 

Test	Expected	Got
<pre>print(count_operations((3, 4, -1)))</pre>	5	5
<pre>print(count_operations((1, 2, 3, 4, 5)))</pre>	5	5
<pre>print(count_operations((5, 4, 3, 2, 1)))</pre>	15	15
<pre>print(count_operations((42, )))</pre>	1	1
<pre>print(count_operations((-2, 3, -5, 4, 1)))</pre>	11	11

#### Passed all tests!

Marks for this submission: 1.00/1.00.

# **Question 4**

Correct Mark 1.00 out of 1.00  $\square$  Flag question

## **Question text**

There is a malfunctioning keyboard where some letter keys do not work. All other keys on the keyboard work properly.

Given a string text of words separated by a single space (no leading or trailing spaces) and a string brokenLetters of all distinct letter keys that are broken, return the number of words in text you can fully type using this keyboard.

Example 1:

Input: text = "hello world", brokenLetters = "ad"

Input

Output:

1

Explanation: We cannot type "world" because the 'd' key is broken.

Result

#### For example:

hello world ad	1
Faculty Upskilling in Pytho	on Programming 2
Answer:(penalty regime: 0  def func(a:str,b:str)- >int:     a=a.lower()     b=b.lower()     w=a.split()     b1=set(b)     count=0     for i in w:         if not set(i)&b1:             count+=1     return count a=input() b=input() print(func(a,b))	0 %)

# **Question 6**

Correct Mark 1.00 out of 1.00  $\square$  Flag question

#### **Question text**

Given a tuple and a positive integer k, the task is to find the count of distinct pairs in the tuple whose sum is equal to K.

## **Examples:**

```
Input: t = (5, 6, 5, 7, 7, 8), K = 13
Output: 2
Explanation:
Pairs with sum K(=13) are \{(5, 8), (6, 7), (6, 7)\}.
Therefore, distinct pairs with sum K(=13) are \{(5, 8), (6, 7)\}.
Therefore, the required output is 2.
```

For example:

## Input Result

```
1,2,1,2,5
3
1,2
0
```

```
def fun(t,k):
    s=set()
    p=set()
    for n in t:
        c=k-n
        if c in s:

p.add(tuple(sorted((n, c))))
        s.add(n)
    return len(p)
t=tuple(map(int,input()).split(',')))
k=int(input())
print(fun(t,k))
```

## Input Expected Got

```

Correct

Marks for this submission: 1.00/1.00.

# **Question 8**

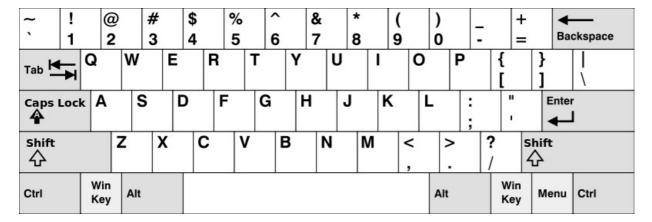

Correct Mark 1.00 out of 1.00  $\square^{\mathbb{P}}$  Flag question

## **Question text**

Given an array of strings words, return the words that can be typed using letters of the alphabet on only one row of American keyboard like the image below.

# In the American keyboard:

- the first row consists of the characters "gwertyuiop",
- the second row consists of the characters "asdfghjkl", and
- the third row consists of the characters "zxcvbnm".

## Example 1:

```
Input: words = ["Hello","Alaska","Dad","Peace"]
Output: ["Alaska","Dad"]
```

#### Example 2:

Input: words = ["omk"]
Output: []

# Example 3:

Input: words = ["adsdf","sfd"]
Output: ["adsdf","sfd"]

For example:

# **Input Result**

```
Hello Alaska Dad Peace
```

```
def
function(word,rows):
  l=word.lower()
  for row in rows:
    if all(char in
row for char in I):
       return True
  return False
def find(words):
  rows=

## **Question text**

Coders here is a simple task for you, Given string str. Your task is to check whether it is a binary string or not by using python set.

Examples:

Input: str = "01010101010"

Output: Yes

Input: str = "REC101"

Output: No

For example:

# Input Result

01010101010 Yes

```
010101 10101 No
```

```
Answer:(penalty regime: 0 %)

def bin(s):
    s=set(s)
    if
s.issubset({'0','1'}):
        return 'Yes'
    else:
        return 'No'
print(bin(input()))
```

## Input Expected Got

01010101010 Yes Yes

REC123 No No
010101 10101 No No

Passed all tests!

Correct

Marks for this submission: 1.00/1.00.

## **Question 10**

Correct Mark 1.00 out of 1.00 □ Flag question

## **Question text**

Given an array of integers nums containing n+1 integers where each integer is in the range [1, n] inclusive. There is only **one** repeated number in nums, return this repeated number. Solve the problem using set.

## Example 1:

Input: nums = [1,3,4,2,2]
Output: 2

#### Example 2:

**Input:** nums = [3,1,3,4,2]

Output: 3

For example:

## Input Result

1 3 4 4 2 4

```
def dup(n):
    s=set()
    for i in n:
        if i in s:
            return i
            s.add(i)
    a=input()
    n=list(map(int,a.split()
))
    print(dup(n))
```

Input							Expected Got			
1	3	4	4	2				4	4	
1	2	2	3	4	5	6	7	2	2	

Passed all tests!

Correct

Marks for this submission: 1.00/1.00.
